## Categorical Semantics for FILL

$(\otimes, \mathbf{1}, \multimap)$  is a symmetric monoidal closed structure

$$A \otimes B \multimap C \text{ iff } A \multimap (B \multimap C) \text{ iff } B \multimap (A \multimap C)$$

$$(A \otimes \mathbf{1}) \multimap A \text{ and } A \multimap (A \otimes \mathbf{1})$$

$(\wp, \mathbf{0})$  is a symmetric monoidal structure

$$(A \wp B) \multimap (B \wp A)$$

$$(A \wp \mathbf{0}) \multimap A \text{ and } A \multimap (A \wp \mathbf{0})$$

interaction via either of

weak distributivity  $(A \otimes (B \wp C)) \multimap ((A \otimes B) \wp C)$

Grishin(b)  $((A \multimap B) \wp C) \multimap (A \multimap (B \wp C))$

Collapse to (classical) MLL: if we add converse of Grishin(b)

Grishin(a)  $(A \multimap (B \wp C)) \multimap ((A \multimap B) \wp C)$

What is FILL?

Existing sequent calculi

A Display Calculus for FILL

Nested Sequent Calculus for FILL

Separation

Further Work

## Proof Theory of FILL: problem and solutions

Remember: we need comma on the right to accommodate  $\wp$

Problem and existing solutions:

multiple conclusions

single conclusion

existing solutions

$$\frac{\Gamma, A \vdash B, \Delta}{\Gamma \vdash A \multimap B, \Delta}$$

$$\frac{\Gamma, A \vdash B}{\Gamma \vdash A \multimap B, \Delta}$$

$$\frac{\Gamma, A \vdash B, \Delta}{\Gamma \vdash A \multimap B, \Delta} (\dagger)$$

unsound

no cut-elimination

cut-elimination

†: side-conditions which ensure that  $A$  is “independent” of  $\Delta$

Hyland, de Paiva 1993: type assignments to ensure that the variable typed by  $A$  not appear free in the terms typed by  $\Delta$

Bierman 1996:  $(a \wp b) \wp c \vdash a, ((b \wp c) \multimap d) \wp (e \multimap (d \wp e))$  has no cut-free derivation in the Hyland and de Paiva calculus

## Display calculus for (an extension of) FILL

Structural Constant and Binary Connectives:  $\Phi$  ,  $<$   $>$   
 Antecedent Structure:  $X_a \ Y_a ::= A \mid \Phi \mid X_a, Y_a \mid X_a < Y_s$   
 Succedent Structure:  $X_s \ Y_s ::= A \mid \Phi \mid X_s, Y_s \mid X_a > Y_s$   
 Sequent:  $X_a \vdash Y_s$  (drop subscripts to avoid clutter)

Display Postulates: reversible structural rules

$$\frac{\frac{X_a \vdash Y_a > Z_s}{X_a, Y_a \vdash Z_s}}{Y_a \vdash X_a > Z_s} \qquad \frac{\frac{Z_a < Y_s \vdash X_s}{Z_a \vdash X_s, Y_s}}{Z_a < X_s \vdash Y_s}$$

Display Property: For every antecedent (succedent) part  $Z$  of the sequent  $X \vdash Y$ , there is a sequent  $Z \vdash Y'$  (resp.  $X' \vdash Z$ ) obtainable from  $X \vdash Y$  using only the display postulates, thereby displaying the  $Z$  as the whole of one side

## Logical rules: introduced formula is always displayed

$$\begin{array}{ll} \text{(id)} \quad p \vdash p & \text{(cut)} \quad \frac{X \vdash A \quad A \vdash Y}{X \vdash Y} \\ \text{(1}\vdash\text{)} \quad \frac{\Phi \vdash X}{\mathbf{1} \vdash X} & \text{(}\vdash\mathbf{1}\text{)} \quad \Phi \vdash \mathbf{1} \\ \text{(0}\vdash\text{)} \quad \mathbf{0} \vdash \Phi & \text{(}\vdash\mathbf{0}\text{)} \quad \frac{X \vdash \Phi}{X \vdash \mathbf{0}} \\ \text{(\otimes}\vdash\text{)} \quad \frac{A, B \vdash X}{A \otimes B \vdash X} & \text{(}\vdash\otimes\text{)} \quad \frac{X \vdash A \quad Y \vdash B}{X, Y \vdash A \otimes B} \\ \text{(\wp}\vdash\text{)} \quad \frac{A \vdash X \quad B \vdash Y}{A \wp B \vdash X, Y} & \text{(}\vdash\wp\text{)} \quad \frac{X \vdash A, B}{X \vdash A \wp B} \\ \text{(\multimap}\vdash\text{)} \quad \frac{X \vdash A \quad B \vdash Y}{A \multimap B \vdash X > Y} & \text{(}\vdash\multimap\text{)} \quad \frac{X \vdash A > B}{X \vdash A \multimap B} \\ \text{(<}\vdash\text{)} \quad \frac{A < B \vdash X}{A < B \vdash X} & \text{(}\vdash<\text{)} \quad \frac{X \vdash A \quad B \vdash Y}{X < Y \vdash A < B} \end{array}$$

read upwards, one rule is a “rewrite” while other “constrains”

## Structural rules: no occurrences of formula meta-variables

all sub-structural properties captured in a modular way

$$\begin{array}{ll} \text{(\Phi}\vdash\text{)} \quad \frac{X, \Phi \vdash Y}{X \vdash Y} & \text{(\vdash}\Phi\text{)} \quad \frac{X \vdash \Phi, Y}{X \vdash Y} \\ \text{(Ass}\vdash\text{)} \quad \frac{W, (X, Y) \vdash Z}{(W, X), Y \vdash Z} & \text{(\vdash Ass)} \quad \frac{W \vdash (X, Y), Z}{W \vdash X, (Y, Z)} \\ \text{(Com}\vdash\text{)} \quad \frac{X, Y \vdash Z}{Y, X \vdash Z} & \text{(\vdash Com)} \quad \frac{Z \vdash Y, X}{Z \vdash X, Y} \\ \text{(Grnb}\vdash\text{)} \quad \frac{W, (X < Y) \vdash Z}{(W, X) < Y \vdash Z} & \text{(\vdash Grnb)} \quad \frac{W \vdash (X > Y), Z}{W \vdash X > (Y, Z)} \end{array}$$

$$((A \multimap B) \wp C) \multimap (A \multimap (B \wp C))$$

## Categorical semantics for bi-intuitionistic linear logic BiILL

$(\otimes, \mathbf{1}, \multimap)$  is a symmetric monoidal closed structure  
 $A \otimes B \multimap C$  iff  $A \multimap (B \multimap C)$  iff  $B \multimap (A \multimap C)$   
 $(A \otimes \mathbf{1}) \multimap A$  and  $A \multimap (A \otimes \mathbf{1})$

$(<, \wp, \mathbf{0})$  is a symmetric monoidal co-closed structure  
 $A \multimap (B \wp C)$  iff  $(A < B) \multimap C$  iff  $(A < C) \multimap B$   
 $(A \wp \mathbf{0}) \multimap A$  and  $A \multimap (A \wp \mathbf{0})$

interaction via either of

$$\text{Grishin(b)} \quad ((A \multimap B) \wp C) \multimap (A \multimap (B \wp C))$$

$$\text{dualGrishin(b)} \quad ((A \otimes B) < C) \multimap (A \otimes (B < C))$$

Collapse to (classical) MLL: if we add converse of either

# Soundness, completeness and cut-elimination

**Thm:** The sequent  $X \vdash Y$  is derivable iff the formula-translation  $\tau_a(X) \multimap \tau_s(Y)$  is BiILL-valid

**Proof:** the display calculus proof rules and the arrows of the free BiILL-category are inter-definable.

**Thm:** If  $X \vdash Y$  is derivable then it is cut-free derivable.

**Proof:** The rules obey conditions C1-C8 given by Belnap (1982), hence the calculus enjoys cut-admissibility

So we have a Display Calculus for BiILL ... is it sound for FILL?

# From BiILL back to FILL

**Problem:** Nice Display Calculus for BiILL ... is it sound for FILL?

**Display calculus:** must create antecedent  $<$  structures in its derivation of FILL-formulae in order to display and undisplay; and  $<$  is structural equivalent to  $\multimap$ , not in FILL

**Question:** is BiILL a conservative extension of FILL (that is, are BiILL-derivable FILL-formulae FILL-derivable?)  
we were not able to find a categorial proof

**Compare:** to tense logic Kt say where there is a simple semantic proof that Kt is a conservative extension of K (same frames)

## Diagram showing the method

$\implies$  every valid formula in the source is also valid in the target  
 $\longrightarrow$  as above, but for FILL formulae only

1. because all FILL-category arrows are also in BiILL-categories
2. requires some translation between rules, not unduly difficult
3. Belnap's general cut-elimination theorem for Display Calculi
4. straightforward: the rule sets are almost equivalent
5.  $\implies$ : some work; uses Lemmas in CSL2013 paper  
 $\iff$ : this is the really difficult result, *many* cases
6. uses the key (easy) property of BiILL<sub>dn</sub>: that a BiILL<sub>dn</sub> derivation of a FILL<sub>dn</sub> sequent lies entirely within FILL<sub>dn</sub>
7. we have items 2 to 5 above for BiILL-category  $\iff$  BiILL<sub>dn</sub>  
 But we have to prove this separately for FILL.

## Nested sequent calculi

**Nested sequent:** a formula or a **multiset** of nested sequents,

**Shallow nested sequent calculus:** Notational variant of display calculi where  $\Rightarrow$  replaces all occurrences of  $\vdash$  and  $<$  and  $>$ ; comma constructs multisets (so associative and commutative)

**Turn Rules:** reversible rules using **multisets** of nested sequents and formulae, correspond to Display Calculus rules

$$\frac{S_2 \Rightarrow (S_1 \Rightarrow T)}{S_1, S_2 \Rightarrow T}$$

$$\frac{(S \Rightarrow T_2) \Rightarrow T_1}{S \Rightarrow (T_1, T_2)}$$

$$\frac{\frac{X_a \vdash Y_a > Z_s}{X_a, Y_a \vdash Z_s}}{Y_a \vdash X_a > Z_s}$$

$$\frac{\frac{Z_a < Y_s \vdash X_s}{Z_a \vdash X_s, Y_s}}{Z_a < X_s \vdash Y_s}$$

**Display Property:** similar to Display Calculi: given a nested sequent  $S \Rightarrow T$ , we can use only the structural turn rules above to get any part of  $S$  or  $T$  alone on one side of outermost  $\Rightarrow$

## Shallow nested sequent calculus for BiILL

Logical rules:

$$\frac{}{p \Rightarrow p} id$$

$$\frac{S \Rightarrow S', A \quad A, T \Rightarrow T'}{S, T \Rightarrow S', T'} cut$$

$$\frac{}{0 \Rightarrow \cdot} 0_l \quad \frac{S \Rightarrow T}{S \Rightarrow T, 0} 0_r$$

$$\frac{S \Rightarrow T}{S, 1 \Rightarrow T} 1_l \quad \frac{}{\cdot \Rightarrow 1} 1_r$$

$$\frac{S, A, B \Rightarrow T}{S, A \otimes B \Rightarrow T} \otimes_l$$

$$\frac{S \Rightarrow A, T \quad S' \Rightarrow B, T'}{S, S' \Rightarrow A \otimes B, T, T'} \otimes_r$$

$$\frac{S, A \Rightarrow T \quad S', B \Rightarrow T'}{S, S', A \wp B \Rightarrow T, T'} \wp_l$$

$$\frac{S \Rightarrow A, B, T}{S \Rightarrow A \wp B, T} \wp_r$$

$$\frac{S \Rightarrow A, T \quad S', B \Rightarrow T'}{S, S', A \multimap B \Rightarrow T, T'} \multimap_l$$

$$\frac{S \Rightarrow T, (A \Rightarrow B)}{S \Rightarrow T, A \multimap B} \multimap_r$$

$$\frac{S, (A \Rightarrow B) \Rightarrow T}{S, A \prec B \Rightarrow T} \prec_l$$

$$\frac{S \Rightarrow A, T \quad S', B \Rightarrow T'}{S, S' \Rightarrow A \prec B, T, T'} \prec_r$$

Navigation icons

## Shallow nested sequent calculus for BiILL

Structural Rules: Grishin (b) analogues

$$\frac{T, (S \Rightarrow S') \Rightarrow T'}{(S, T \Rightarrow S') \Rightarrow T'} gl$$

$$\frac{S \Rightarrow (S' \Rightarrow T'), T}{S \Rightarrow (S' \Rightarrow T', T)} gr$$

$$(Grnb \vdash) \frac{W, (X < Y) \vdash Z}{(W, X) < Y \vdash Z}$$

$$(\vdash Grnb) \frac{W \vdash (X > Y), Z}{W \vdash X > (Y, Z)}$$

**Thm:** Every formula has a cut-free nested shallow sequent derivation iff it has cut-free display calculus derivation

We use only the cut-free version of BiILL<sub>sn</sub>

**Proof search issue:** (as with Display Calculus):  
how to absorb the turn and *gl* and *gr* rules ?

Navigation icons

## Deep nested sequents: just apply the rules inside contexts

$X[\ ]$  and  $\mathcal{U}$  and  $\mathcal{V}$  are hollow.  $\frac{X[\mathcal{U}, p \Rightarrow p, \mathcal{V}]}{X[\mathcal{U}, p \Rightarrow p, \mathcal{V}]}$   $id^d$  similarly for units (no cut rule)

$$\frac{X[S, A, B \Rightarrow T]}{X[S, A \otimes B \Rightarrow T]} \otimes_l^d$$

$$\frac{X_1[S_1 \Rightarrow A, T_1] \quad X_2[S_2 \Rightarrow B, T_2]}{X[S \Rightarrow A \otimes B, T]} \otimes_r^d$$

$$\frac{X_1[S_1 \Rightarrow A, T_1] \quad X_2[S_2, B \Rightarrow T_2]}{X[S, A \multimap B \Rightarrow T]} \multimap_l^d$$

$$\frac{X[S \Rightarrow T, (A \Rightarrow B)]}{X[S \Rightarrow T, A \multimap B]} \multimap_r^d$$

$$\frac{X_1[S_1, A \Rightarrow T_1] \quad X_2[S_2, B \Rightarrow T_2]}{X[S, A \wp B \Rightarrow T]} \wp_l^d$$

$$\frac{X[S \Rightarrow A, B, T]}{X[S \Rightarrow A \wp B, T]} \wp_r^d$$

$$\frac{X[S, (A \Rightarrow B) \Rightarrow T]}{X[S, A \prec B \Rightarrow T]} \prec_l^d$$

$$\frac{X_1[S_1 \Rightarrow A, T_1] \quad X_2[S_2, B \Rightarrow T_2]}{X[S \Rightarrow A \prec B, T]} \prec_r^d$$

**Hollow:**  $X[\ ]$  contains no formulae ( $\Rightarrow$ -tree of empty nodes)

**Merge:**  $X[\ ] \in X_1[\ ] \bullet X_2[\ ]$  and  $S \in S_1 \bullet S_2$  and  $T \in T_1 \bullet T_2$

Navigation icons

## Deep nested sequents: just apply the rules inside contexts

Propagation rules: allow formulae to be moved in a context

$$\frac{X[S \Rightarrow (S', A \Rightarrow T'), T]}{X[S, A \Rightarrow (S' \Rightarrow T'), T]} pl_1$$

$$\frac{X[S', (S \Rightarrow A, T) \Rightarrow T']}{X[S', (S \Rightarrow T) \Rightarrow A, T']} pr_1$$

$$\frac{X[S, (S' \Rightarrow T'), A \Rightarrow T]}{X[S, (S', A \Rightarrow T') \Rightarrow T]} pl_2$$

$$\frac{X[S \Rightarrow A, (S' \Rightarrow T'), T]}{X[S \Rightarrow (S' \Rightarrow A, T'), T]} pr_2$$

**Thm:** the turn rules and rules *gl* and *gr* are (cut-free) admissible

**Thm:** if a nested sequent is (cut-free) derivable in the deep calculus then it is cut-free derivable in the shallow calculus

**Thm:** if a nested sequent is cut-free derivable in the shallow calculus then it is (cut-free) derivable in the deep calculus

**Cor:** the deep and shallow nested calculi derive the same sequents

Navigation icons

## From BiILL back to FILL

**Nested FILL-sequent:** nested sequent that has no nesting of sequents on the left of  $\Rightarrow$  and no occurrences of  $\prec$

**Why?** entire  $\text{BiILL}_{dn}$ -derivation of a nested FILL-sequent contains only nested FILL-sequents (look at the rules!)

**$\text{FILL}_{dn}$ :** remove  $\prec_l^d$ ,  $\prec_r^d$ ,  $pl_2$  and  $pr_1$  from  $\text{BiILL}_{dn}$

**Separation Thm:** nested FILL-sequents are derivable in  $\text{FILL}_{dn}$  iff they are derivable in  $\text{BiILL}_{dn}$ .

**Thm:** every rule of  $\text{FILL}_{dn}$  preserves FILL-validity downwards

**Cor:**  $\text{FILL}_{dn}$  is sound and complete for FILL-validity

**Cor:** BiILL is a conservative extension of FILL

## Formalisation

**use of Isabelle:** work verified in Isabelle theorem prover

**value of formal verification:** an earlier proof was found to be flawed (after some months' work)

**time taken:** formal proof took about 1/2 year

**most difficult:** showing that shallow nested rules admissible in deep nested calculus — *many* cases, since (eg)  $X[S \Rightarrow T]$  ( $S$  and  $T$  multisets!) can match given sequent  $Z$  in *many* ways

**programmed tactics:** many programming of tactics and combinations of them — SML programming interface invaluable

## Formalisation: multisets in nested sequents

**Display Calculus structure in Isabelle:** involves (sub-)structures (recursively), with binary operators, and formulae

**nested sequents in Isabelle ??:** would involve *multisets* of nested sequents

**Isabelle couldn't do this:** (lists — yes, multisets — no) so we just used a ',' operator, and defined an equivalence relation (so, eg  $A \Rightarrow (B, B' \Rightarrow C) \equiv A \Rightarrow (B', B \Rightarrow C)$ )

**consequential change:** definition of merge,  $X_1[ ] \bullet X_2[ ]$ , becomes much simpler

**many lemmas:** we needed many lemmas about using this  $\equiv$ : how much easier if we could use multisets directly ??

**Isabelle developments:** possibility to use multisets recently introduced into Isabelle

**this work is in Isabelle 2005:** too much incompatible change in Isabelle developments for me to change all my proofs

## Cut-free derivation in our display calculus

$$\frac{\frac{\frac{a \vdash a \quad b \vdash b}{a \wp b \vdash a, b} \quad c \vdash c}{(a \wp b) \wp c \vdash a, b, c}}{(a \wp b) \wp c < a \vdash b, c}}{(a \wp b) \wp c < a \vdash b \wp c \quad d \vdash d}{b \wp c \multimap d \vdash ((a \wp b) \wp c < a) > d \quad e \vdash e}{(b \wp c \multimap d) \wp e \vdash (((a \wp b) \wp c < a) > d), e}}{(b \wp c \multimap d) \wp e \vdash ((a \wp b) \wp c < a) > d, e}}{(b \wp c \multimap d) \wp e, ((a \wp b) \wp c < a) \vdash d \wp e}{(a \wp b) \wp c < a \vdash (b \wp c \multimap d) \wp e > d \wp e}}{(a \wp b) \wp c < a \vdash (b \wp c \multimap d) \wp e \multimap d \wp e}{(a \wp b) \wp c \vdash a, (b \wp c \multimap d) \wp e \multimap d \wp e}$$

No annotations, but many extra structural connectives

## Cut-free derivation in the deep nested calculus

$$\begin{array}{c}
 \frac{\cdot \Rightarrow (b \Rightarrow b)}{a \Rightarrow a, (\cdot \Rightarrow \cdot)} \quad \frac{\cdot \Rightarrow (c \Rightarrow c)}{b \Rightarrow (\cdot \Rightarrow b)} \quad \frac{\cdot \Rightarrow (c \Rightarrow c)}{c \Rightarrow (\cdot \Rightarrow c)} \\
 \frac{a \wp b \Rightarrow a, (\cdot \Rightarrow b)}{(a \wp b) \wp c \Rightarrow a, (\cdot \Rightarrow b, c)} \\
 \frac{(a \wp b) \wp c \Rightarrow a, (\cdot \Rightarrow b \wp c)}{(a \wp b) \wp c \Rightarrow a, (b \wp c \multimap d \Rightarrow d)} \quad \frac{\cdot \Rightarrow (d \Rightarrow d)}{\cdot \Rightarrow (e \Rightarrow e)} \\
 \frac{(a \wp b) \wp c \Rightarrow a, ((b \wp c \multimap d) \wp e \Rightarrow d, e)}{(a \wp b) \wp c \Rightarrow a, ((b \wp c \multimap d) \wp e \Rightarrow d \wp e)} \\
 \frac{(a \wp b) \wp c \Rightarrow a, (b \wp c \multimap d) \wp e \multimap d \wp e}{(a \wp b) \wp c \Rightarrow a, (b \wp c \multimap d) \wp e \multimap d \wp e}
 \end{array}$$

No annotations, only commas as structural connective, but sequents are nested  $(\dots \Rightarrow \dots) \dots \Rightarrow \dots (\dots \Rightarrow \dots)$

## Cut-free derivation in the deep nested calculus

$$\begin{array}{c}
 \frac{\cdot \Rightarrow (b \Rightarrow b)}{a \Rightarrow a, (\cdot \Rightarrow \cdot)} \quad \frac{\cdot \Rightarrow (c \Rightarrow c)}{b \Rightarrow (\cdot \Rightarrow b)} \quad \frac{\cdot \Rightarrow (c \Rightarrow c)}{c \Rightarrow (\cdot \Rightarrow c)} \\
 \frac{a \wp b \Rightarrow a, (\cdot \Rightarrow b)}{(a \wp b) \wp c \Rightarrow a, (\cdot \Rightarrow b, c)} \\
 \frac{(a \wp b) \wp c \Rightarrow a, (\cdot \Rightarrow b \wp c)}{(a \wp b) \wp c \Rightarrow a, (b \wp c \multimap d \Rightarrow d)} \quad \frac{\cdot \Rightarrow (d \Rightarrow d)}{\cdot \Rightarrow (e \Rightarrow e)} \\
 \frac{(a \wp b) \wp c \Rightarrow a, ((b \wp c \multimap d) \wp e \Rightarrow d, e)}{(a \wp b) \wp c \Rightarrow a, ((b \wp c \multimap d) \wp e \Rightarrow d \wp e)} \\
 \frac{(a \wp b) \wp c \Rightarrow a, (b \wp c \multimap d) \wp e \multimap d \wp e}{(a \wp b) \wp c \Rightarrow a, (b \wp c \multimap d) \wp e \multimap d \wp e}
 \end{array}$$

No annotations, only commas as structural connective, but sequents are nested

## Example derivation in our display calculus

$$\begin{array}{c}
 (\wp \vdash) \frac{a \vdash a \quad b \vdash b}{a \wp b \vdash a, b} \quad c \vdash c \\
 (\wp \vdash) \frac{(a \wp b) \wp c \vdash (a, b), c}{(a \wp b) \wp c < a \vdash b, c} \\
 (\text{ass}) \frac{(a \wp b) \wp c \vdash a, (b, c)}{(a \wp b) \wp c < a \vdash b, c} \\
 (\text{drp}) \frac{(a \wp b) \wp c < a \vdash b, c}{(a \wp b) \wp c < a \vdash b \wp c} \\
 (\vdash \wp) \frac{(a \wp b) \wp c < a \vdash b \wp c \quad d \vdash d}{(a \wp b) \wp c \multimap d \vdash ((a \wp b) \wp c < a) > d} \quad e \vdash e \\
 (\multimap \vdash) \frac{b \wp c \multimap d \vdash ((a \wp b) \wp c < a) > d \quad e \vdash e}{(b \wp c \multimap d) \wp e \vdash (((a \wp b) \wp c < a) > d), e} \\
 (\vdash \text{Grnb}) \frac{(b \wp c \multimap d) \wp e \vdash (((a \wp b) \wp c < a) > d), e}{(b \wp c \multimap d) \wp e \vdash ((a \wp b) \wp c < a) > (d, e)} \\
 (\text{rp}) \frac{(b \wp c \multimap d) \wp e \vdash ((a \wp b) \wp c < a) > (d, e)}{(b \wp c \multimap d) \wp e, ((a \wp b) \wp c < a) \vdash d, e} \\
 (\vdash \wp) \frac{(b \wp c \multimap d) \wp e, ((a \wp b) \wp c < a) \vdash d, e}{(b \wp c \multimap d) \wp e, ((a \wp b) \wp c < a) \vdash d \wp e} \\
 (\text{rp}) \frac{(a \wp b) \wp c < a \vdash (b \wp c \multimap d) \wp e > (d \wp e)}{(a \wp b) \wp c < a \vdash (b \wp c \multimap d) \wp e > (d \wp e)} \\
 (\vdash \multimap) \frac{(a \wp b) \wp c < a \vdash (b \wp c \multimap d) \wp e > (d \wp e)}{(a \wp b) \wp c < a \vdash (b \wp c \multimap d) \wp e \multimap (d \wp e)} \\
 (\text{drp}) \frac{(a \wp b) \wp c \vdash a, (b \wp c \multimap d) \wp e \multimap (d \wp e)}{(a \wp b) \wp c \vdash a, (b \wp c \multimap d) \wp e \multimap (d \wp e)}
 \end{array}$$

But we implicitly created an occurrence of  $\multimap$  via  $<$

## From BiLL back to FiLL

$$\begin{array}{c}
 \frac{a \vdash a \quad b \vdash b}{a \wp b \vdash a, b} \quad c \vdash c \\
 \frac{(a \wp b) \wp c \vdash (a, b), c}{(a \wp b) \wp c < a \vdash b, c} \\
 (?) \frac{(a \wp b) \wp c \vdash a, (b, c)}{(a \wp b) \wp c < a \vdash b, c} \\
 (\vdash \wp) \frac{(a \wp b) \wp c < a \vdash b, c}{(a \wp b) \wp c < a \vdash b \wp c} \quad d \vdash d \\
 (\multimap \vdash) \frac{b \wp c \multimap d \vdash ((a \wp b) \wp c < a) > d \quad e \vdash e}{(b \wp c \multimap d) \wp e \vdash (((a \wp b) \wp c < a) > d), e} \\
 (?) \frac{(b \wp c \multimap d) \wp e \vdash (((a \wp b) \wp c < a) > d), e}{(b \wp c \multimap d) \wp e \vdash ((a \wp b) \wp c < a) > (d, e)} \\
 (?) \frac{(b \wp c \multimap d) \wp e, ((a \wp b) \wp c < a) \vdash d, e}{(b \wp c \multimap d) \wp e, ((a \wp b) \wp c < a) \vdash d \wp e} \\
 (\vdash \wp) \frac{(b \wp c \multimap d) \wp e, ((a \wp b) \wp c < a) \vdash d \wp e}{(a \wp b) \wp c < a \vdash (b \wp c \multimap d) \wp e > (d \wp e)} \\
 (?) \frac{(a \wp b) \wp c < a \vdash (b \wp c \multimap d) \wp e > (d \wp e)}{(a \wp b) \wp c < a \vdash (b \wp c \multimap d) \wp e > (d \wp e)} \\
 (\vdash \multimap) \frac{(a \wp b) \wp c < a \vdash (b \wp c \multimap d) \wp e > (d \wp e)}{(a \wp b) \wp c < a \vdash (b \wp c \multimap d) \wp e \multimap (d \wp e)} \\
 (?) \frac{(a \wp b) \wp c \vdash a, (b \wp c \multimap d) \wp e \multimap (d \wp e)}{(a \wp b) \wp c \vdash a, (b \wp c \multimap d) \wp e \multimap (d \wp e)}
 \end{array}$$

## Belnap's Eight Conditions a lá Kracht

- (C1) Each formula variable occurring in some premise of a rule  $\rho$  is a subformula of some formula in the conclusion of  $\rho$ .
- (C2) *Congruent parameters* is a relation between parameters of the identical structure variable occurring in the premise and conclusion
- (C3) Each parameter is congruent to at most one structure variable in the conclusion. Equivalently, no two structure variables in the conclusion are congruent to each other.
- (C4) Congruent parameters are either all antecedent or all succedent parts of their respective sequent.
- (C5) A formula in the conclusion of a rule  $\rho$  is either the entire antecedent or the entire succedent. Such a formula is called a **principal formula** of  $\rho$ .
- (C6/7) Each rule is closed under simultaneous substitution of arbitrary structures for congruent parameters.

## Belnap's Eight Conditions a lá Kracht

- (C8) If there are rules  $\rho$  and  $\sigma$  with respective conclusions  $X \vdash A$  and  $A \vdash Y$  with formula  $A$  principal in both inferences (in the sense of C5) and if *cut* is applied to yield  $X \vdash Y$ , then either  $X \vdash Y$  is identical to either  $X \vdash A$  or  $A \vdash Y$ ; or it is possible to pass from the premises of  $\rho$  and  $\sigma$  to  $X \vdash Y$  by means of inferences falling under *cut* where the cut-formula always is a proper subformula of  $A$ .

$$\frac{\frac{X \vdash C > D}{X \vdash C \multimap D} \quad \frac{U \vdash C \quad D \vdash Z}{C \multimap D \vdash U > Z}}{X \vdash U > Z} \text{ cut}$$

$$\frac{U \vdash C \quad \frac{\frac{X \vdash C > D}{X, C \vdash D} \quad D \vdash Z}{X, C \vdash Z} \text{ cut}}{\frac{U \vdash X > Z}{X, U \vdash Z} \text{ cut}} \text{ cut}$$
